

Evolution that makes the difference

Traditional suspensions require the lubrication of numerous grease points.

Lubrication is a time-consuming and inconvenient operation that must be carried out frequently, increasing both machine downtime and maintenance costs.

**ADR introduces the new *Alpha Zero* suspension:
zero maintenance and zero soil contamination**

Zero maintenance Zero soil contamination

Hydraulic Suspension Alpha Zero:

The innovative axle-suspension system that completely eliminates the need for lubrication.

- All the moving components of the suspension are supported by **elastic technopolymer bushings**, designed to withstand the extreme stresses encountered in agricultural applications.
- Its geometry has been developed to **optimize load distribution** and to reduce stress on the axle's structural components, extending the service life of the entire system.

Thanks to these features, the system is defined as "Zero Maintenance", helping to **reduce machine downtime, maintenance costs, and soil contamination**.
